**THIS PAGE BLANK (USPTO)**

**DESCRIPTION****1,2-AZOLE DERIVATIVES WITH HYPOGLYCEMIC AND HYPOLIPIDEMIC ACTIVITY****Technical Field**

The present invention relates to a 1,2-azole derivative  
5 having an excellent hypoglycemic action and hypolipidemic  
action, which is useful as an agent for the prophylaxis or  
treatment of diabetes, hyperlipidemia, arteriosclerosis,  
impaired glucose tolerance and the like.

**Background Art**

10 Peroxisome proliferator-activated receptor gamma (PPAR $\gamma$ ),  
a member of the intranuclear hormone receptor superfamily,  
which is typically exemplified by steroid hormone receptors  
and thyroid hormone receptors, plays an important role as a  
master regulator in the differentiation of adipocytes with its  
15 expression induced in the very early stage of adipocyte  
differentiation. PPAR $\gamma$  forms a dimer with the retinoid X  
receptor (RXR) by binding to a ligand, and binds to a  
responsive site of the target gene in the nucleus to directly  
control (activate) transcription efficiency. In recent years,  
20 the possibility that 15-deoxy- $\Delta^{12,14}$  prostaglandin J<sub>2</sub>, a  
metabolite of prostaglandin D<sub>2</sub>, serves as an endogenous ligand  
for PPAR $\gamma$ , has been suggested, and it has been shown that a  
class of insulin sensitivity enhancers, typically exemplified  
by thiazolidinedione derivatives, possess ligand activity for  
25 PPAR $\gamma$ , and that its potency is proportional to its hypoglycemic  
action or adipocyte differentiation-promoting action (Cell,  
vol. 83, p.803 (1995); The Journal of Biological Chemistry,  
vol. 270, p.12953 (1995); Journal of Medicinal Chemistry, vol.  
39, p.655 (1996)). Furthermore, in recent years, it has been  
30 shown that 1) PPAR $\gamma$  is expressed in cultured cells of human  
liposarcoma origin, whose proliferation is ceased by the  
addition of a PPAR $\gamma$  ligand (Proceedings of the National Academy  
of Sciences of the United States of America, vol. 94, p.237  
(1997)), 2) nonsteroidal anti-inflammatory drugs, typically  
35 exemplified by indomethacin and fenoprofen, have PPAR $\gamma$  ligand

activity (The Journal of Biological Chemistry, vol. 272, p.3406 (1997)), 3) PPAR $\gamma$  is expressed at high levels in activated macrophages, with the transcription of a gene involved in inflammation inhibited by the addition of a ligand therefor (Nature, vol. 391, p.79 (1998)), 4) PPAR $\gamma$  ligands suppress the production of inflammatory cytokines (TNF $\alpha$ , IL-1 $\beta$ , IL-6) by monocytes (Nature, vol. 391, p.82 (1998)), 5) hypertrophy of adipocyte, accumulation of lipid and expression of insulin resistance are suppressed in PPAR $\gamma$  hetero deficient mouse (Molecular Cell, vol. 4, p.597 (1999)), 6) PPAR $\gamma$  ligand inhibits differentiation of 10T1/2 cells to adipocytes by PPAR $\gamma$  agonist (Proceedings of The National Academy of Sciences of The United States of America, vol. 96, p.6102 (1999)), 7) PPAR $\gamma$  ligand suppresses differentiation of 3T3-L1 cells to adipocytes by PPAR $\gamma$  agonist (Molecular Endocrinology, vol. 14, p.1425 (2000)) and the like.

Peroxisome proliferator-activated receptor delta (PPAR $\delta$ ) is a member of the intranuclear hormone receptor PPAR family, forms a dimer with a retinoid X receptor (RXR) by ligand binding as in other PPAR families, and binds with a responsive element located upstream of the target gene in nucleus, thereby directly controlling transcription efficiency. As the ligand of PPAR $\delta$ , long chain fatty acids and carbaprostacyclin can be mentioned; however, a target gene specific to PPAR $\delta$  has not been identified as yet. PPAR $\delta$  shows ubiquitous expression, but shows particularly strong expression in gut, kidney and heart. As regards PPAR $\delta$ , it has been reported that PPAR $\delta$  shows differentiation-promoting effect on mouse preadipocytes (The Journal of Biological Chemistry, vol. 274, p.21920-21925 (1999); The Journal of Biological Chemistry, vol.275, p.38768-38773 (2000); The Journal of Biological Chemistry, vol.276, p.3175-3182 (2001)); it shows UCP-2 and UCP-3 expression-promoting effect on rat and human skeletal muscle cells (The Journal of Biological Chemistry, vol.276, p.10853-10860 (2001); Endocrinology, vol. 142, p.4189-4194 (2001)); it shows

differentiation-promoting effect on oligodendrocytes (Molecular Cell Biology, vol. 20, p.5119-5128 (2000); Glia, vol. 33, p.191-204 (2001); it shows HDL-C increasing effect in db/db mouse (FEBS letters, vol. 473, p.333-336 (2000)); it shows HDL-C increasing effect and LDL-C, VLDL and TG-lowering effect in obesity Rhesus monkey; and it shows promoting effect on cholesterol transport of human monocyte THP-1 cells via ApoA1 (Proceedings of The National Academy of Sciences of The United States of America, vol. 98, p.5306-5311 (2001)).

Moreover, it has been reported that PPAR $\delta$  is involved in colon cancer (Cell, vol. 99, p.335-345 (1999); Proceedings of The National Academy of Sciences of The United States of America, vol. 98, p.2598-2603 (2001)), embryo implantation during gestation (Genes and Development, vol. 13, p.1561-1574 (1999)), bone resorption in osteoclasts (The Journal of Biological Chemistry, vol. 275, p.8126-8132 (2000)), apoptosis in inflammation (Genes and Development, vol. 15, p.3263-3277 (2001)), and regulation of type 2 acyl-CoA synthetase in brain (The Journal of Biological Chemistry, vol. 274, p.35881-35888 (1999)).

Regarding diagnostic criteria of diabetes, new diagnostic criteria were reported by the Japan Diabetes Society in 1999.

According to this report, diabetes is a condition wherein the fasting blood glucose level (glucose concentration in venous plasma) is not less than 126 mg/dl, the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test (75 g OGTT) is not less than 200 mg/dl, or the non-fasting blood glucose level (glucose concentration in venous plasma) is not less than 200 mg/dl. In addition, a condition which does not fall within the scope of the above definition of diabetes, and which is not a "condition wherein the fasting blood glucose level (glucose concentration in venous plasma) is less than 110 mg/dl or the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test (75 g OGTT) is less than 140 mg/dl" (normal type), is called the "borderline type".

In addition, regarding diagnostic criteria for diabetes,

new diagnostic criteria were reported by ADA (American Diabetic Association) in 1997 and by WHO in 1998.

According to these reports, diabetes is a condition wherein the fasting blood glucose level (glucose concentration in venous plasma) is not less than 126 mg/dl, and the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test is not less than 200 mg/dl.

In addition, according to the above reports, impaired glucose tolerance is a condition wherein the fasting blood glucose level (glucose concentration in venous plasma) is less than 126 mg/dl, and the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test is not less than 140 mg/dl and less than 200 mg/dl. Furthermore, according to the ADA report, a condition wherein the fasting blood glucose level (glucose concentration in venous plasma) is not less than 110 mg/dl and less than 126 mg/dl, is called IFG (impaired fasting glucose). On the other hand, according to the WHO report, a condition of IFG (impaired fasting glucose) as such wherein the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test is less than 140 mg/dl, is called IFG (impaired fasting glycemia).

The compound of the present invention can be used as an agent for the prophylaxis or treatment of diabetes, borderline type, impaired glucose tolerance, IFG (impaired fasting glucose) and IFG (impaired fasting glycemia) as defined by the above new diagnostic criteria. Furthermore, the compound of the present invention can also be used to prevent the progression of the borderline type, impaired glucose tolerance, IFG (impaired fasting glucose) or IFG (impaired fasting glycemia) to diabetes.

20 analogous thereto.

When a mixed acid anhydride is used as the reactive derivative of compound (I-5), moreover, compound (I-5) is reacted with a chlorocarbonic ester (e.g., methyl chlorocarbonate, ethyl chlorocarbonate, isobutyl  
25 chlorocarbonate) in the presence of a base (e.g., amines such as triethylamine, N-methylmorpholine, N,N-dimethylaniline and the like; alkali metal salt such as sodium hydrogen carbonate, sodium carbonate, potassium carbonate and the like) and then reacted with compound (IV).

Groups in Organic Synthesis, published by John Wiley and Sons (1980). For example, there may be used methods employing an acid, a base, ultraviolet rays, hydrazine, phenylhydrazine, sodium N-methyldithiocarbamate, tetrabutylammonium fluoride, 5 palladium acetate, a trialkylsilyl halide (e.g., trimethylsilyl iodide, trimethylsilyl bromide), or the like, the reduction method, and the like.

When compound (I) contains an optical isomer, a stereomer, a position isomer, or a rotation isomer, these 10 isomers are also contained as Compound (I) and can each be obtained as a single substance by means of a method known *per se* of synthesis or separation. For example, when an optical isomer is present in Compound (I), the optical isomer separated from said compound is also included in Compound (I).

15 Optical isomers can be produced by a method known *per se*. Specifically, optical isomers are obtained by using an optically active synthesis intermediate, or optically resolving a racemate of the final product by a conventional method.

20 Examples of the methods of optical resolution include methods known *per se*, such as the fractional recrystallization method, the chiral column method, and the diastereomer method.

#### 1) Fractional recrystallization method

A method wherein a salt is formed between a racemate and 25 an optically active compound [e.g., (+)-mandelic acid, (-)-mandelic acid, (+)-tartaric acid, (-)-tartaric acid, (+)-1-phenethylamine, (-)-1-phenethylamine, cinchonine, (-)-cinchonidine, brucine], which salt is separated by fractional recrystallization, etc., and, if desired, subjected to a 30 neutralization process, to yield a free optical isomer.

#### 2) Chiral column method

A method wherein a racemate or a salt thereof is applied to a column for optical isomer separation (chiral column). In the case of liquid chromatography, for example, optical 35 isomers are separated by adding a mixture of the optical

isomers to a chiral column such as ENANTIO-OVM (produced by Tosoh Corporation) or CHIRAL series produced by DAICEL CHEMICAL IND., and developing it in water, various buffers (e.g., phosphate buffer), an organic solvent (e.g., ethanol, methanol, isopropanol, acetonitrile, trifluoroacetic acid, diethylamine), or a solvent mixture thereof. In the case of gas chromatography, for example, a chiral column such as CP-Chirasil-DeX CB (produced by GL Science) is used to separate optical isomers.

### 3) Diastereomer method

A method wherein a racemate mixture and an optically active reagent are chemically reacted to yield a diastereomer mixture, which is then subjected to ordinary means of separation (e.g., fractional recrystallization, chromatography) to obtain single substances, which are subjected to a chemical reaction such as hydrolysis reaction to cut off the optically active reagent moiety, whereby the desired optical isomer is obtained. For example, when Compound (I) has hydroxy or primary or secondary amino in the molecule thereof, said compound, an optically active organic acid (e.g., MTPA [ $\alpha$ -methoxy- $\alpha$ -(trifluoromethyl)phenylacetic acid], (-)-menthoxyacetic acid) and the like may be subjected to a condensation reaction to yield a diastereomer of an ester or amide, respectively. On the other hand, when Compound (I) has a carboxyl group, said compound and an optically active amine or an alcohol reagent may be subjected to a condensation reaction to yield a diastereomer of an amide or ester, respectively. The diastereomer thus separated is converted to an optical isomer of the original compound by subjecting it to an acid hydrolysis or basic hydrolysis reaction.

5 **Test Example 2**

Plasma anti-arteriosclerosis index-enhancing action in mice

Test compounds were mixed in a powdery diet (CE-2, Japan Clea) at the concentration of 0.005%, and freely given to KKA<sup>y</sup> mice (9 to 12 weeks old, 5 mice per group), a model of obese  
10 and non-insulin dependent diabetes (type 2 diabetes), for four days. During this period, water was given freely. Blood was sampled from orbital venous plexus and components in plasma separated from blood were determined. Total cholesterol levels were determined by using L type Wako Cholesterol (Wako Pure  
15 Chemical Industries, Ltd.). Precipitation reagent for HDL cholesterol (Wako Pure Chemical Industries, Ltd.) was added to a part of the plasma to precipitate non-HDL lipoprotein, and cholesterol (HDL cholesterol) in the resulting supernatant was determined. The plasma anti-arteriosclerosis index [(HDL  
20 cholesterol/total cholesterol)×100] was calculated by using these cholesterol levels. The results are given in Table 2.

In the Table, "Plasma anti-arteriosclerosis index-enhancing action (%)" represents the percent increase (%) of plasma anti-arteriosclerosis index in the treatment group,  
25 when the plasma anti-arteriosclerosis index in the non-treatment group is taken as 100%.

# INTERNATIONAL SEARCH REPORT

International Application No.

PCT/JP 03/06389

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claim 28 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 1-16 (all partly), 18, 19-31 (all partly), 32, 33  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-16 (all partly), 18, 19-31 (all partly), 32, 33

Present compound claims 1-16, 24-27 and 30 relate to an extremely large number of possible compounds (see, in particular, the non-limitative (open-ended) expressions, such as "a ring optionally having 1 to 3 substituents", "optionally substituted hydrocarbon group", "hydroxy-protecting group", "optionally substituted heterocyclic ring"...etc.). Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible.

Consequently, the search has been carried out for those parts of claims 1-16 which appear to be supported and disclosed, namely those parts relating to the compounds wherein

the ring A is an (optionally substituted) benzene, pyridine, or pyridazine ring (cf., the present claim 3),

the ring B is either an (optionally substituted) pyrazol-4-yl or isoxazol-5-yl (4-yl and 5-yl in respect of the group -Xa-Ya-Xb-Yb), the groups Xa and Yb represent bonds (cf., the present claims 12 and 14), the group Xb is either a bond or a -O- group (cf., the present claim 13), the group Ya is C1-6 alkylene or C2-6 alkenylene (cf., the present claim 7),

the group Xc is a bond or a -O- group (cf., the present claim 15),

the group Yc is C1-6 alkylene or C2-6 alkenylene (cf., the present claim 16),

the group R represents -OR4 (cf., the present claim 11), and

the ring C is an (optionally substituted) monocyclic aromatic ring as defined in the present claim 1.

The search and the search report is therefore only complete with respect to the present claim 17.

Claims 1-16 have only been searched as far as the above-mentioned group of compounds is concerned.

It is further noted that the expression "prodrug" as used in the present claims 18-24 and 27-30 is unclear in the sense of Article 6 PCT (this expression does not comprise any information as regards the structure of the compounds concerned). It is therefore impossible to compare the claimed compounds with what is set out in the prior art. This lack of clarity is such as to render a meaningful search impossible.

Consequently, the present claim 18 has not been searched.

Claims 19-24 and 27-30 have only been searched as far as the compounds as defined hereinbefore are concerned.

Furthermore, the initial phase of the novelty-search on the intermediate compounds of the present claim 33 revealed such a vast number of novelty-destroying documents (cf., for example, the last five documents of the International Search Report) that it was impossible to determine which part of claim 33 may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT).

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

For these reasons, no search has been carried out for the said claim 33 (and claim 32 which is directed to the preparation of those compounds of claim 33 wherein R13a represents CH<sub>2</sub>OH).

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
